

## **CUCCOLINI SRL**

CUCCOLINI was founded in 1946 and is now Europe's leading screening manufacturer with the delivery of up to 3,000 machines per year. The vibrating round screeners are used for classifying, scalping and dedusting of products of the ceramic and chemical industry, the food and animal feed industry, the pharmaceutical and cosmetics industry and others.

CUCCOLINI's manufacturing programme has been expanded in the meantime by tumbler screens and the high-performance separators ScreenX. Tumbler Screeners from one deck to five deck design are used for very precise and fine screening applications. ScreenX machines enable the processing of humid and so-called difficult-to-screen applications by using the multi-frequency vibration technology which is integrated in these machines. The MFVexcite technology presents a purely mechanical device with performance results exceeding those of the expensive ultrasonic cleaning device. All screeners are manufactured in mild steel or stainless steel and upon request according to ATEX or other customized specifications.

CUCCOLINI and VIRTO show their high quality machines and equipment at the upcoming exhibitions. If you need more information please contact us. Our team will be pleased to hear from you or to meet you at
