WASHING SOLUTIONS FOR PHARMACEUTICAL INDUSTRY

For more than 20 years IWT have specialised in the design, manufacture and installation of a wide variety of washing solutions for the pharmaceutical industry worldwide. The IWT W300 Series pharmaceutical grade washer is a modular machine available in four different sizes from 0.25 to 2 m³ as usable volume of the washing chamber, fully compliant with the cGMP, GAMP and the FDA regulatory standards, and designed to wash and dry components made either of glass, plastic, stainless steel or any other metal, as well as a wide range of removable parts from the various kinds of processing equipment - compressing tools, drums, feeding hoppers, injectors, dosing pumps etc. Bottles, vials, flask and various tools including pallets and small size containers used in production or in the warehouse of pharmaceutical manufacturing plants can also be processed. This W300 series washer is the outcome of several years of experience in manufacturing washing equipment. With its customized loading baskets, high throughput achieved by accurate evaluation of the load and the way it is presented inside the wash chamber, combined with a specific know-how of the washing process, it represents the ideal solution for those seeking a high degree of flexibility. Outstanding cleaning performances are achieved thanks to the strong mechanical power of the water sprayed through upper and lower rotating arms, and directly onto the washing baskets by means of a quick lock connection. Effective hot HEPA filtered air ensures effective drying so that components can be re-used immediately after the washing process, thus minimizing any downtime on the processing lines. Large panoramic glass doors, operated automatically and interlocking to maintain the separation between areas at different levels of contamination, allow visual inspection of the wash and drying process whilst it is in progress.
