

WATSON-MARLOW SRL

VISIT WATSON-MARLOW PUMPS GROUP AT PHARMINTECH!

Leading pump company, Watson-Marlow Pumps Group (stand D72 – Pad. 19) will showcase its range of positive displacement pump technologies at the 2010 Pharmintech Exhibition.

Watson-Marlow MasoSine will be exhibiting pumps to handle shear-sensitive and variable viscosity products in food, toiletry/cosmetic, pharmaceutical and industrial applications. W-M MasoSine positive displacement pumps are highly reliable and economical for sanitary and industrial applications. One rotor, one shaft and one seal ensure that users benefit from simple and low cost maintenance.

Watson-Marlow's bespoke peristaltic pump technology is at the heart of a range of new single-use filter assemblies and process-ready hardware systems from life science equipment manufacturers. The pumps are uniquely suited to the requirements of disposable manufacturing systems. Additionally, benchtop pumps for accurate, programmed dosing/dispensing provide accuracies of better than 0.5%. Dose size, batch quantity and interval time between doses is programmed into the pump for rapid dispensing applications - 100ml can be dispensed in less than 3 seconds. Visitors from the pharmaceutical and diagnostic sectors will be interested in the aseptic liquid filling, plugging and crimp capping system from Watson-Marlow Flexicon. This technology is ideally suited to small to medium-sized batch production flexibility – from laboratory benchtop to clinic trial stage – where high precision and efficiency are required.
